

Table of contents

Preface	13
Introduction	19
The project - The contributors	21
Acknowledgements	25
1. History of solar observation	27
1.1 Pre-telescopic observations	27
1.2 First telescopic observations	28
1.3 Observation in the 19th century	30
1.4 The 20th century	32
1.5 The quest for high resolution: 130 years of solar imaging	35
2. Understanding our star	39
2.1 The quiet Sun	39
2.1.1 The solar surface (photosphere)	39
2.1.2 Granulation	40
2.1.3 Revelations of spectral analysis	42
2.1.4 Chromosphere	43
2.1.5 Corona	44
2.1.6 Towards the interior of the Sun	45
2.1.7 The energy of the Sun	46
2.2 The active Sun	47
2.2.1 Activity cycles	47
2.2.2 Solar activity: description	47
2.2.3 Solar activity: some explanations	51
2.3 The Sun, its life, its work	54
2.3.1 Life and death of the Sun	54
2.3.2 The Sun and us	55
2.3.3 In conclusion	55
3. Observing the Sun safely	57
4. Observation conditions	59
4.1 What is turbulence?	60
4.1.1 Atmospheric turbulence	60
4.1.2 The different layers of turbulence	60
4.1.3 Image quality, seeing and the Fried parameter	61
4.1.3.1 The effects of air turbulence on star images	62
4.1.3.2 The effects of air turbulence on solar images	63
4.2 Which aperture for observation of the Sun?	64
4.2.1 Which aperture for imaging?	65
4.2.2 Which aperture for visual observation?	67
4.3 Local turbulence and instrument turbulence	67
4.3.1 Local turbulence and the choice of observation site	67
4.3.1.1 Influence of the nature of the ground	67
4.3.1.2 Influence of the wind at ground level	67
4.3.1.3 Influence of the height of the instrument above the ground	68
4.3.1.4 Observing next to a body of water	69
4.3.1.5 Observing in the mountains	69
4.3.1.6 Influence of cloud cover	70
4.3.2 Turbulence related to telescope shelters	71
4.3.2.1 The dome	71
4.3.2.2 The open shelter	71

4.3.3 Instrument turbulence	71
4.4 The variation of turbulence during the day: what is the best time for observation?	73
4.5 Measuring the seeing in real-time with a SSM	73
4.5.1 Scintillation of stars, planets and the Sun	73
4.5.2 The Solar Scintillation Monitor and its use by amateurs	75
4.5.2.1 Search and comparison of solar observation sites	75
4.5.2.2 Optimization of a solar observation site	75
4.5.2.3 Automatic triggering of acquisitions	75
4.5.2.4 Implementation and limitations of SSM	75
5. Telescopes for solar observation	77
5.1 Introduction	77
5.2 The main telescope designs	77
5.2.1 The refracting telescope	77
5.2.1.1 Salient features	77
5.2.1.2 All things considered: the refractor for solar observation	80
5.2.2 The Newtonian reflector	80
5.2.2.1 Principle	80
5.2.2.2 Optical characteristics	81
5.2.2.3 All things considered: the Newtonian reflector for solar observation	82
5.2.3 The Schmidt-Cassegrain telescope	82
5.2.3.1 Principle	82
5.2.3.2 Optical characteristics of the "classic" version	83
5.2.3.3 Optical characteristics of the "improved" versions	83
5.2.3.4 Technical aspects	84
5.2.3.5 All things considered: the Schmidt-Cassegrain telescope for solar observation	84
5.2.4 The Dall-Kirkham Telescope	84
5.2.4.1 Principle	84
5.2.4.2 Optical characteristics	84
5.2.4.3 Mechanical aspects	85
5.2.4.4 All things considered: the Dall-Kirkham telescope for solar observation	85
5.2.5 The classical Cassegrain telescope	85
5.2.5.1 Principle	85
5.2.5.2 Optical performance	85
5.2.5.3 All things considered: the classical Cassegrain telescope for solar observation	86
5.2.6 Maksutov-Cassegrain telescope	86
5.2.6.1 Principle	86
5.2.6.2 Performance	86
5.2.6.3 All things considered: the Maksutov-Cassegrain telescope for solar observation	86
5.3 Resolution and aperture	86
5.4 Quality criteria for high resolution optics	88
5.4.1 Tolerances for the complete instrument	88
5.4.2 Surface tolerance for internally mounted filters	89
5.4.3 Surface tolerance for the 45° secondary mirror of a Newtonian Telescope	90
5.4.4 Wavelength and geometric precision of a mirror surface	90
5.4.5 Cumulative error of different optical elements in a telescope	90
5.5 The effects of obstruction	90
5.5.1 Diffraction by a central obstruction	91
5.5.1.1 Influence of the central obstruction for different telescope apertures	92
5.5.1.2 Conclusion on the influence of the central obstruction	92
5.5.2 Diffraction by spacers of a Fabry-Perot etalon	92
5.5.3 Sub-pupil diffraction	92
5.5.4 Diffraction by the secondary mirror spider	92
5.6 Collimation and star testing	93
5.6.1 Collimation	93
5.6.2 Principle of star testing	95
5.6.2.1 Astigmatism	95
5.6.2.2 Trefoil	95
5.6.2.3 Spherical aberration	95
5.7 Appendix: more on wavefront error	97
6. Observation of the photosphere	99
6.1 Introduction	99
6.2 Which instrument for observing the photosphere?	99
6.2.1 Observation of the photosphere ... it's simple!	99
6.2.2 Refractor or reflector?	99

6.2.3 Small or large aperture?	100
6.2.4 Heating of lenses: does it pose a risk?	100
6.2.5 All things considered, which is the best instrument?	100
6.3 The features visible on the photosphere	100
6.3.1 Visible details according to the aperture of the instrument	100
6.3.2 The solar zoo of the photosphere: spots, pores, umbral dots, faculae, etc.	101
6.3.2.1 Spots, umbral dots and penumbral grains.	101
6.3.2.2 Granulation	103
6.3.2.3 Intergranular bright points	103
6.3.2.4 Faculae	103
6.3.2.5 Do sunspots have a color?	104
6.3.2.6 Light bridges	106
6.3.2.7 Deformation of the granulation near spots or pores	107
6.3.2.8 Pores	107
6.3.2.9 The Wilson effect	107
6.4 Observation by eyepiece projection	110
6.4.1 Projection screen and its orientation	111
6.4.2 Calculating the solar disk diameter on the screen	112
6.4.3 The Solarscope™	112
6.4.4 The SunGun	112
6.4.5 Solar Projection Eyepiece	112
6.5 Full aperture filters	113
6.5.1 Glass filters	113
6.5.2 Film filters	113
6.5.2.1 Choosing filter density	113
6.5.2.2 The limits of film filters	114
6.6 Solar wedge and uncoated mirrors	114
6.6.1 Introduction	114
6.6.2 Some optical principles	115
6.6.3 The Herschel prism	115
6.6.3.1 Principle of the Herschel prism	116
6.6.3.2 The Lacerta™ solar wedge with Brewster angle reflection	116
6.6.3.3 A modified H α Herschel prism.	117
6.6.3.4 Which barrel diameter for the solar wedge?	118
6.6.3.5 The output beam of the solar wedge	119
6.6.4 Solar telescopes with uncoated mirror	119
6.6.4.1 How to do it?	119
6.6.4.2 For which types of telescope?	120
6.7 Color filters	120
6.7.1 Effect of filter color on the theoretical resolution of the images	121
6.7.2 Effect of filter color on the optical performance of the instrument	121
6.7.3 Effect of filter color on seeing	121
6.7.4 Effect of filter color on atmospheric dispersion	122
6.7.5 Effect of filter color on the contrast of images	123
6.7.6 Types of color filters	124
6.7.7 Some specialized filters for the observation of the photosphere	124
6.7.7.1 Continuum filters	124
6.7.7.2 G-band filter at 430.5 nm	125
6.7.7.3 K-line filter at 396 nm	126
6.7.7.4 TiO filter at 706 nm	127
6.7.8 In short: which filters for visual observation?	127
6.7.9 In short: which filters for imaging?	128
6.8 Appendices	128
6.8.1 Density and transmission	128
6.8.2 Polarization of light	129
6.8.3 Transmission of neutral and polarizing filters in the infrared	130
6.8.4 Another variant of the solar wedge	131
6.8.5 Influence of filter wavelength on high resolution images of granulation	131
6.8.6 Influence of filter wavelength on the detection of intergranular bright points	133
7. Observation of the chromosphere	139
7.1 Introduction	139
7.2 Chromospheric layers visible in Hα and Ca II	139
7.3 The observation of the chromosphere in Ca II	140
7.3.1 The Ca II K and H lines	140

7.3.2 What do we see with a Ca II filter?	140
7.3.2.1 Sunspots	141
7.3.2.2 Light bridges	141
7.3.2.3 Reverse granulation	141
7.3.2.4 The chromospheric network	141
7.3.2.5 Plages	141
7.3.2.6 Solar flares	146
7.3.2.7 The chromospheric fringe	146
7.3.2.8 Prominences	146
7.3.2.9 Filter bandwidth and height of observed layer	146
7.3.2.10 Influence of the filter bandwidth on the visibility of the filaments on solar disk	150
7.3.2.11 Visibility of fibrils in the Ca II line	150
7.3.2.12 Correspondence between G-band and Ca II intergranular bright points	150
7.3.3 Instruments and filters for Ca II observation	152
7.3.3.1 Commercial offerings	152
7.3.3.2 Filter bandwidth	152
7.3.3.3 Optimal f-ratio	155
7.3.3.4 The ERF and maximum usable aperture	155
7.3.3.5 What resolution and what aperture for Ca II?	155
7.3.3.6 Performance of refractors and Barlow lenses in the near UV	156
7.3.3.7 Using a Ca II filter on a reflecting telescope?	156
7.4 Observation of the chromosphere in Hα	156
7.4.1 What do we see with a H α filter?	157
7.4.1.1 Visibility of details according to the aperture of the telescope	157
7.4.1.2 Main observable features	157
7.4.1.3 Influence of the filter bandwidth	168
7.4.1.4 Observation in the wings of the H α line	171
7.4.2 Instruments and filters for H α observation	171
7.4.2.1 The components of the filtration system	171
7.4.2.2 Three main filter mounting configurations	172
7.4.2.3 Commercial offerings	173
7.4.2.4 Two mounting variants devised by amateurs	175
7.4.3 The Fabry-Perot etalon and its use	176
7.4.3.1 Operating principle of the Fabry-Perot etalon	176
7.4.3.2 Anatomy of a H α filter with a mica-spaced etalon	178
7.4.3.3 Anatomy of an H α filter with an air-spaced etalon	179
7.4.3.4 Double stack filter systems	179
7.4.3.5 Triple stack mounting	181
7.4.3.6 Mounting the etalon in the front position	181
7.4.3.7 Mounting the etalon in an internal position in a collimated beam	183
7.4.3.8 Mounting the etalon in the rear position in a telecentric beam	188
7.4.3.9 Mounting the etalon behind a Barlow lens (when using a refractor)	191
7.4.3.10 Air-spaced or mica-spaced etalons: how do we choose?	192
7.4.4 And the Lyot filter?	194
7.4.5 The energy rejection filter (ERF)	195
7.4.5.1 Main filters available on the market	195
7.4.5.2 ERF coating on Schmidt corrector plate or on mirror	197
7.4.5.3 Flux transmitted by the ERF	198
7.4.5.4 Adjusting the tilt of the ERF	199
7.4.5.5 ERF in internal position: what diameter?	199
7.4.6 Blocking filter (BF)	200
7.4.7 The Induced Transmission Filter (ITF)	201
7.4.8 Some practical tips	202
7.4.8.1 How to tune the filter to the H α line center	202
7.4.8.2 Imaging: how to eliminate Newton's rings and interference fringes?	203
7.4.8.3 Mica-spaced etalons: operation in low or high temperature	204
7.4.8.4 Imaging with etalon in rear position: dealing with small pixel size	204
7.4.8.5 Imaging: uniformity and orientation of the filter	204
7.4.8.6 Double stack mounting and ghost images	204
7.4.8.7 Storage and lifetime of H α solar filters	204
7.5 Appendix 1: Fabry-Perot formulas	205
7.5.1 Basic formulas	205
7.5.1.1 Influence of the manufacturing precision of the etalon plates	205
7.5.1.2 Center wavelength (CWL) shift as a function of tilt	206
7.5.1.3 Bandwidth variation (FWHM) as a function of beam tilt	206
7.5.2 Etalon mounting in a converging beam	206
7.5.2.1 Formulas for the variation in CWL and FWHM in a converging beam	206
7.5.2.2 Telecentric assembly in detail	206
7.5.2.3 Sub-optimal telecentric assembly	208
7.5.2.4 Calculation of the field angle with a Barlow lens	209
7.5.2.5 Calculation of the field angle at the focus of a Cassegrain telescope	210

7.6 Appendix 2: measurement of the transmission profile of the elements of a Coronado Hα filter	210
7.7 Appendix 3: the Hϵ line	212
7.8 Appendix 4: height of the layers sampled in Ca K in areas of quiet Sun and in plages	212
7.9 Appendix 5: influence of the filter CWL on Ca H images	212
7.10 Appendix 6: influence of the filter CWL on Hα images	213
7.11 Appendix 7: testing etalon quality	215
7.11.1 Test in diffuse light and a H α lamp	215
7.11.2 Test in collimated beam and a H α lamp	216
7.11.3 Test in telecentric beam using Sun as a light source	217
8. The coronagraph	219
8.1 History of the coronagraph	219
8.2 Principle of operation	220
8.2.1 Two types of coronagraph	220
8.2.2 Principle of coronagraph operation	222
8.2.3 Observation of the solar corona	222
8.2.3.1 Diffusion of light by the atmosphere	222
8.2.3.2 Diffusion of light by the coronagraph optics	223
8.2.3.3. Observation of the corona by amateurs	225
8.3. The coronagraph in detail	227
8.3.1 The occulting cone	227
8.3.2 The H α filter	228
8.3.3 Manufacturers	229
8.3.4 Using a coronagraph	230
8.4 Construction of a coronagraph	232
8.5 Appendix 1: diffraction, Lyot diaphragm and apodization	232
8.5.1 Diffraction of light by the objective	232
8.5.2 Lyot diaphragm and apodization	234
8.6 Appendix 2: position of the optical elements of the coronagraph	234
8.7 Appendix 3: observation of prominences in bands other than Hα	236
9. Amateur solar instruments	237
9.1 Introduction	237
9.2 Norma Desprez's solar Maksutov	237
9.3 François Rouvière's 210 mm solar telescope	239
9.4 Christian Viladrich's 300 mm solar telescope	241
9.4.1 Objectives and specifications	241
9.4.2 Choosing the optical design	242
9.4.3 Primary mirror coated or not?	243
9.4.4 Choice of material for the primary mirror	244
9.4.5 Rear face of the primary mirror polished or frosted?	245
9.4.6 Thermal aspects and minimization of internal turbulence	246
9.4.6.1 Amount of heat received at primary focus	246
9.4.6.2 Heating of the primary mirror	246
9.4.6.3 Other thermal aspects and control of internal turbulence	246
9.4.7 Stray light	247
9.4.8 Secondary mirror and spider	247
9.4.9 Focus assembly	248
9.4.10 Collimation	248
9.4.11 What's the balance sheet after four years of use?	248
9.5 François Rouvière's folded 175 mm aspherical lens refractor	252
9.6 Jean-Pierre Brahic's 230 mm solar refractor	253
9.6.1 The project	253
9.6.2 What do we see through a 230 mm solar telescope?	258
9.6.3 Assessment after six years of use	258
9.6.4 The cost of a dream?	259
9.6.5 The future?	259
9.7 Philippe Tosi's 225 mm coronagraph	260
9.7.1 Optics	261
9.7.1.1 Calculation and construction of the 225 mm aspherical lens	261
9.7.1.2 Field lens	262
9.7.1.3 Transfer lens and Lyot diaphragm	262
9.7.1.4 H α filter	262

9.7.2 Coronagraph tube	262
9.7.3 Occulting cone	262
9.7.4 Equatorial mount	264
9.7.5 Results obtained	264
9.8 Jean-Jacques Poupeau's spectroheliograph	266
9.8.1 Introduction	266
9.8.2 Principle of the instrument	266
9.8.3 Optical layout	266
9.8.4 Construction	266
9.8.4.1 The spectrograph	266
9.8.4.2 The 98 mm solar telescope	268
9.8.4.3 Equatorial mount	268
9.8.4.4 Details of the assembled instrument	269
9.8.5 Synthesis of the image using a video camera	269
9.8.6 Processing spectral images to spectroheliograms	270
9.8.7 Results achieved	270
9.8.8 Conclusions	270
9.9 Harald Paleske's 225 mm Unigraph refractor	272
9.9.1 The first development	272
9.9.2 A 225/2600 mm FH Unigraph for H α solar observation	272
9.9.3 Conclusion	274
9.10 Bob Yoesle's 140 mm double-stack Hα refractor	277
9.10.1 The beginning of a passion	277
9.10.2 First step in H α	277
9.10.3 Solar nirvana?	278
9.10.4 The quest goes on	278
9.10.5 The SM140/SM90 refractor	279
9.10.6 Rebuilding the SM140/SM90 refractor	280
9.10.7 First light with the rebuilt SM140/90 refractor	282
9.10.7 Back to work again	284
9.10.8 Success at last	286
10. Drawing, a school of observation	289
10.1 Sketching as a school of observation	289
10.1.1 The purpose of sketching	289
10.1.2 Drawing material	289
10.1.3 Which instrument to use?	289
10.1.4 Eyepiece and filter choice	290
10.1.5 One method among many	290
10.1.6 And now in H α ?	291
10.1.7 To go further	291
10.2 The art of drawing	291
10.2.1 Drawing the solar photosphere in white light	291
10.2.2 Drawing the Sun in H α wavelength	294
11. Image acquisition	297
11.1 Introduction	297
11.2 Daytime polar alignment	297
11.2.1 For visual observation	297
11.2.2 For imaging	297
11.3 Focal length, image field and sampling	299
11.3.1 Focal length, sensor size and angular field of view	299
11.3.2 Sampling	299
11.3.3 Optimal sampling for high resolution	300
11.3.4 How to adjust the sampling value: Barlow or eyepiece?	301
11.3.4.1 Eyepiece projection	302
11.3.4.2 Use of a Barlow lens	302
11.3.5 How to measure the sampling and the effective focal length of the instrument?	304
11.4 Focusing	305
11.4.1 What focus tolerance?	305
11.4.2 Focusing techniques	306
11.5 Solar autoguiding	307
11.5.1 Autoguiding with acquisition software	307

11.5.2 Autoguiding with guide telescope	307
11.6 Digital sensors	308
11.6.1 Main features	308
11.6.1.1 The sensor	308
11.6.1.2 Analog-digital converter and number of bits	311
11.6.1.3 Readout speed and interface with a PC	311
11.6.1.4 Transparency of the window to UV and IR	312
11.6.2 Some useful technical concepts	312
11.6.2.1 Noise	312
11.6.2.2 Signal to noise ratio	313
11.6.2.3 The dynamic range	314
11.6.3 All things considered: which camera is best for solar imaging?	315
11.7 Video cameras and their settings	315
11.7.1 Windowing	316
11.7.2 Number of acquisition bits	316
11.7.3 Setting the gain	316
11.7.4 Setting the offset (or black level)	316
11.7.5 Setting the exposure time	316
11.7.6 Capture rate	317
11.7.7 Adjusting the gamma	317
11.8 Acquisition with video cameras	318
11.8.1 Format of the acquisition file	318
11.8.2 Duration of the acquisition	319
11.8.3 Animations	319
11.8.4 CMOS Fixed Pattern Noise Correction	320
11.8.5 Making flat field images ("flats")	320
11.8.6 Cleaning the sensor	321
11.8.7 What to do in case of glare?	321
11.8.8 Limit camera warm-up	321
11.8.9 Mechanical mounting of the camera	321
11.9 DSLRs and their settings	322
11.9.1 Introduction	322
11.9.2 Full-disk solar images	322
11.9.2.1 Imaging in white light	322
11.9.2.2 H α imaging	323
11.9.2.3 Ca II imaging	323
11.9.2.4 Imaging in the sodium line	323
11.9.3 Close-up images of solar details	324
11.9.4 Using DSLR in video mode	324
11.9.5 Control of the DSLR by a PC	324
11.9.6 Using an external LCD screen with HDMI connection	327
11.10 Appendix	327
11.10.1 Conversion between dB and number of bits	327
11.10.2 Measuring the dynamic range and SNR of a camera	327
11.10.3 Approximate measurement of the focal length of a Barlow lens	328
12. Image processing	329
12.1 The basic treatment: registering/sorting/stacking	330
12.1.1 The basic principles	330
12.1.1.1 Image registration	330
12.1.1.2 Image quality sorting	330
12.1.1.3 Image stacking	331
12.2 AutoStakkert! v3	331
12.2.1 A quick guide	331
12.2.2 The most important settings in more detail	332
12.2.2.1 How many images to stack?	332
12.2.2.2 How many alignment points?	336
12.2.2.3 Local (AP) or global (frame): special case of acquisitions under conditions of variable sky transparency	337
12.2.3 AutoStakkert!: Additional parameters	337
12.2.3.1 Pretreatment: dark and flat images	337
12.2.3.2 Batch processing of multiple video files	338
12.2.3.3 Limit frames	338
12.2.3.4 Browsing in the video file	338
12.2.3.5 Maximum size of images	338

12.2.3.6 Noise robust	339
12.2.3.7 Sharpen	339
12.2.3.8 Drizzle and resize Images	340
12.3. The enhancement of micro-contrast	341
12.3.1 Correction of reflections	342
12.3.2 The different scale levels of detail in an image	342
12.3.3 Unsharp mask processing	343
12.3.3.1 Example of the unsharp mask treatment in white light	343
12.3.3.2 Example of unsharp mask treatment in H α	345
12.3.4 Wavelet processing	345
12.3.4.1 Example of wavelet processing of a G-band image	345
12.3.4.2 Example of wavelet processing of an image in H α	345
12.3.5 Richardson - Lucy deconvolution treatment	346
12.3.6 Artifacts or real details, what is the limit to treatment?	348
12.3.6.1 Artifacts in white light	349
12.3.6.2 Artifacts in H α	349
12.3.6.3 Artifacts in Ca II H and K	349
12.4. Differentiated local treatments	349
12.4.1 Highlighting details in sunspot umbrae	349
12.4.2 Harmonization between solar disk and prominences	349
12.4.3 "Coronagraph" effect	353
12.5. Finalization of images (gamma, visualization thresholds, colorization)	354
12.5.1 Gamma and visualization thresholds	354
12.5.1.1 Prominences in H α	354
12.5.1.2 Sunspot in H α	354
12.5.1.3 Colorization of images	354
12.6. Mosaics	356
12.7. Animations	361
12.7.1 Creating an animation with ImPPG and Photoshop	361
12.7.1.1 Principle of the method	361
12.7.1.2 Image registration (alignment) with ImPPG	361
12.7.1.3 Producing animations with Photoshop	362
12.7.2 Animation of prominences	364
12.7.2.1 Processing images by scripts in Photoshop	364
12.7.2.2 Image registration with RegiStax 6	364
12.7.2.3 Converting the video file from AVI to MP4 format	364
12.8. Some additional interesting software and utilities	367
12.8.1 SER Player	367
12.8.2 PIPP	367
12.8.3 ImPPG	367
12.8.4 RegiStax 6	367
12.8.5 Astrosurface	367
12.9. Appendix: introduction to color management	367
13. Amateur solar radio astronomy	371
13.1. Introduction	371
13.2. What is radio astronomy?	372
13.2.1 The electromagnetic spectrum	372
13.2.2 The radio telescope	372
13.2.3 The dipole antenna	372
13.2.4 The parabolic antenna	374
13.2.5 The power received by a radio telescope	374
13.2.6 Antenna arrays	376
13.3. Solar activity at radio wavelengths	376
13.3.1 Radio emission mechanisms	377
13.3.1.1 Thermal emission mechanism	377
13.3.1.2 Non-thermal emission mechanisms	377
13.3.1.3 Overview of solar radio emission.	378
13.3.2 Emission from the disturbed or active Sun	378
13.3.2.1 The slowly varying component	378
13.3.2.2 Radio bursts	378
13.4. Lucie: a solar radio telescope for the beginning radio astronomer	381
13.4.1 The different elements of the Lucie radio telescope	381
13.4.1.1 The antenna	381
13.4.1.2 Head and preamplifier	382
13.4.1.3 The receiver	382

13.4.1.4 The recording system	382
13.4.2 Constructing the Lucie Radio Telescope	382
13.4.2.1 The necessary equipment	382
13.4.2.2 Assembly	382
13.4.2.3 Radio frequency interference	384
13.4.2.4 Some technical details of a Satellite Finder	384
13.4.3 A solar radiometry measurement	385
13.4.3.1 Carrying out the observation	385
13.4.3.2 Interpretation of the measurements	386
13.4.4 Some final words about the Lucie radio telescope	387
13.5. Solar radio observation at other wavelengths	388
13.6. Concluding thoughts	388
14. Solar eclipses	391
14.1. What is a solar eclipse?	391
14.1.1 Earth-Moon-Sun system	391
14.1.2 The saros	391
14.1.3 Different types of solar eclipses: partial, annular, hybrid, total	391
14.1.4 Points of contact during an eclipse	392
14.2. Partial eclipse	392
14.2.1 Visual observation	392
14.2.2 Photographing the eclipse	393
14.3. Annular eclipse	393
14.3.1 Visual observation	393
14.3.2 Photographing the eclipse	393
14.4. Hybrid eclipse	393
14.5. Total eclipse	394
14.5.1 Speed of the Moon's shadow	394
14.5.2 What is the duration of totality?	394
14.5.3 Visual observation	394
14.5.4 Photographing the eclipse	396
14.5.4.1 Indicative exposure times	400
14.5.4.2 Some tips for taking beautiful pictures	400
14.5.5 Making a video of the eclipse	402
14.5.6 Visual observation of the eclipse with an instrument	402
14.5.7 Additional tips	402
14.6. Observing the eclipse from an airplane or a ship	402
14.7. Next solar eclipses	403
14.8. The solar corona: shape, structure and brightness	403
14.9. A closer look at totality	408
14.9.1 Observation of stars and earthshine	408
14.9.2 High resolution observation of the corona	408
14.9.3 Possible scientific experiments	414
14.9.3.1 The flash spectrum	414
14.9.3.2 K-corona imaging in polarized light	414
14.10. Processing the images of totality	414
14.10.1 Processing with Photoshop	415
14.10.2 Other processing methods	419
14.10.2.1 Registration of images on the solar disk	419
14.10.2.2 Correction of the radial brightness gradient	419
14.11 Appendix: acquisition control software	421
15. Amateur observing programs	425
15.1 Introduction	425
15.2 Orientation of the Sun on images or drawings	425
15.2.1 Solar orientation in a telescope	425
15.2.2 Frame orientation with respect to the celestial coordinate system	426
15.2.3 Heliographic coordinates	426
15.2.4 Solar grid tools	427
15.2.5 Grids and various measurement tools	427
15.2.6 Useful links	427
15.3 Counting sunspots: Wolf number	428
15.3.1 The program	428
15.3.2 Useful links	428

15.4 Recording sunspot positions	428
15.4.1 The program	428
15.4.2 Useful links	429
15.5 Observation of prominences and other Hα features	430
15.5.1 The program	430
15.5.2 Useful links	430
15.6 Detection of Moreton-Ramsey waves	430
15.6.1 The program	430
15.6.2 Useful links	431
15.7 SOHO/LASCO and STEREO/SECCHI comet detection	431
15.7.1 The program	431
15.7.2 Useful link	432
15.8 Solar stormwatch	432
15.8.1 The program	432
15.8.2 Useful link	432
15.9 Measuring the variation of ovalization of the chromosphere	432
15.9.1 The program	432
15.9.2 Useful links	432
15.10 F-Chroma program	432
15.10.1 The program	432
15.10.2 Useful link	432
15.11 An example of ProAm cooperation: the Associate Observers of Pic du Midi	432
15.11.1 Introduction	432
15.11.2 Birth of the team	432
15.11.3 Birth of the association	434
15.11.4 Equipment in operation	434
15.11.5 Results achieved to date	435
15.11.6 Useful links	436
15.12 Solar studies with an amateur spectroheliograph	436
15.12.1 Introduction	436
15.12.2 A measurement of the solar differential rotation	437
15.12.3 The Dopplergram	440
15.12.4 Spectroscopic study of a rapidly moving solar feature	443
15.12.5 Temperature measurement of a filament	443
15.12.6 The magnetic field of a sunspot	446
15.12.7 Concluding thoughts	450
16. The Sun on the Internet	451
16.1 Introduction	451
16.2 Solar ephemerides	451
16.3 Solar eclipses	451
16.4 Monitoring the activity of the photosphere	452
16.5 Monitoring the activity of the chromosphere	452
16.5.1 Ground based solar observatories	452
16.5.2 Satellite based solar observatories	454
16.6 Composite websites	456
16.7 Websites collecting amateur observations	456
16.8 Forums specialized in solar observation	457
Selected bibliography	459
Chapter references and bibliography	460
Units and solar data	468
List of the largest solar professional telescopes	470
Filter suppliers and manufacturers	471
Glossary	472
